BANG Fei is an archaeologist who is an assistant of a famous archaeologist, the Dr. No. 1 archaeologist in China, Hua Ding Bang. Although they are from rival families, the two are well-known throughout the world for their scholarly endeavors. Why the Inevitable Questions When a Canon EOS M3 Production Model Cuts the Line on USA Why the Inevitable Questions When a Canon EOS M3 Production Model Cuts the Line on USA At a certain point, the technology is good enough to put it on the market. And that's exactly what Canon has done with the latest production EOS M3 camera. This time, the company has chosen to cut the line on the USA and has made the announcement earlier in the year, citing that the new camera will be available in the Asian markets starting in August this year. The camera comes with an impressive feature list: Full-frame 23.5-megapixel APS-C CMOS sensor, which is paired with a DIGIC 7 image processor, and a 16-megapixel sensor in the rear. Of course, one of the biggest enhancements is the built-in Wi-Fi and NFC, as well as the traditional optical viewfinder that's live and instantaneous. The Canon EOS M3 will be available in black and white or black only variants, and it will be priced around \$1,000 USD when it comes to the United States market. Those will be followed by an even more expensive limited edition in September that will come with a lot of special features. However, it's not all good news for American EOS M3 owners. The company has opted to skip the USA completely with this new model, and that means no global warranty from Canon. This camera is a production model and it doesn't come with the same signature guarantee from the first camera, the EF-M line that came with the first 6 months of warranty. What's the reasoning behind this? Canon is aiming to keep the prices relatively affordable for the end user, which is probably the reason for skipping the United States market. Still, we should expect to see a fully functional Canon EOS M3 come to the United States with a full warranty in September this year. The Enigmatic Properties of Polypropylene. Polypropylene (PP) is the most abundant polymer in the world. It has a unique molecular structure with two recurring chemical units

In this chapter, the authors provide an overview of the different animal models currently in use for studying arthritic symptoms and pathology. The pathophysiological mechanisms underlying the symptoms and pathology of rheumatoid arthritis (RA) and osteoarthritis (OA) can be studied using different animal models. These models include the "spontaneous" animal model, the intra-articular model, and the surgically induced model. The "spontaneous" animal models do not rely on the induction of disease; rather, the animals are genetically predisposed to develop arthritis, based on certain genes. The intra-articular model is based on the intra-articular injection of a compound, such as collagen or adjuvants. In this model, the pathophysiological mechanisms of the disease can be studied and the effects of certain treatments can be
